

Power Platform Governance and Best Practices Guide

This guide covers best practices in Power Platform as recommended by Danaher. This guide is intended to inform you of the best practices and standard procedures specific to the Danaher based on frequently asked questions. It is not intended to be a comprehensive guide to Power Platform or a tutorial for performing different tasks. If you need more general information on Power Platform, we recommend reading the [official Microsoft documentation](#).

If you need guidance on what licenses to use, please check the [Power Platform Licensing guide](#).

Environments

Environments managed at the OpCo level for Power Platform. While most Power Apps and Power Automate flows are built in the default environment, OpCo's can request OpCo specific environments.

[Microsoft guide on Power Platform Environments.](#)

Each OpCo already has two environments created for them: Test and Prod. If your OpCo has not used them before, they are not claimed. Please open a ticket with the DanaHER Global Service Desk at servicedesk@danaher.com if you don't know who the owners of your environments are, and we can either find the owner for you or make you the owner.

Additional environments are usually created for the following reasons:

- You plan to use the Dataverse to store your data
- You want finer control over your environment for a specific application built in Power Platform
- You want to enact your own DLP policies rather than using the default DanaHER ones
- You need an environment for HoloLens

New environment set up

Environments should always start with either the full OpCo name or the OpCo abbreviation. In almost all cases, environments are created with a security group to limit access to only members of that OpCo.

If you are requesting a new environment from DanaHER, please provide the following details in your ticket: *Environment Name*, *Region* (default is *United States*), *Type* (*Sandbox*, *production*, or *trial*), *Database for environment* (yes or no), *Dynamics 365 apps* (yes or no), and *owners* (list of email addresses).

After initial set up, you can [add owners yourself](#) without needing to go through DanaHER IT. Environment owners should have the following security roles: Environment Maker, System Customizer, System Administrator. Anyone who develops in Power Platform will at least need the Environment Maker security role.

Dataverse (Common Data Service)

There is only one [Dataverse \(Common Data Service\)](#) per environment. If you plan to use the Dataverse, you must create a new environment for that use case. You cannot use the default environment since it is shared with all OpCo's. Note that apps and flows using the Dataverse require premium licenses and incur additional cost. The Dataverse is usually used when an app or flow needs additional storage capacity or performance that SharePoint cannot provide.

Digital Loss Prevention (DLP) Policies

Environments by default follow the current DanaHER DLP Policy. If you would like to manage your own DLP policy, please create a new DLP Policy and apply it to your environment, then open a ticket with the DanaHER Global Service Desk at servicedesk@danaher.com indicating the name of your environment so we can remove the default DLP policy from your environment.

[Microsoft guide on creating Power Platform DLP Policies](#)

DanaHER applies a blanket DLP policy to the default environment and all other environments that are not intentionally excluded. The connectors allowed in the DanaHER Default DLP policy can be [viewed](#)

[here](#). If you create your own DLP policy for your policy, the expectation is that you are evaluating each connector added with your OpCo's security team.

Connectors

Microsoft-created connectors are usually allowed, but please check the DanaHER DLP policy above. All [premium connectors](#) require some kind of premium licensing at the Microsoft level, see license guide for details.

Some 3rd party connectors are allowed in the default environment. If the connector you need is not allowed, you can still use it if you create your own DLP policy at your OpCo. Some 3rd party connectors have additional licensing costs. You will need to work with your OpCo IT's procurement team if you wish to use a connector with additional 3rd party licensing; this is not managed by DanaHER IT.

Custom connectors are allowed, please open a ticket with the DanaHER Global Service Desk at servicedesk@danaher.com if you need help setting one up.

Power Automate (formerly Microsoft Flow)

[Power Automate](#) is a technology used to automate many tasks such as sending automatic emails, automatically updating a list, automated approvals, and more. Licensing costs for Power Automate depends on the connectors and performance profiles used (check the licensing guide for more details)

Cloud Flows

Most Power Automate Flows are “Cloud Flows” set in the default environment. Any Power Automate Flows (and Power Apps) created in a SharePoint list using the “integrate” feature will be created in the default environment. Flows created at make.powerautomate.com can be created in either the default environment or in an environment managed by your OpCo.

Desktop Flows

Desktop Flows (Both attended and unattended RPA) is allowed but unsupported at Danaher. Danaher’s standard vendor for unattended RPA is UiPath. You can request a license and use Power Automate Desktop Flows, but you will need to open a ticket directly with Microsoft through your OpCo’s IT Service Desk if you need support.

Service Accounts

Flows that are created and ran under a context of a user will break if that user leaves the company, so it is important that all business-critical production flows use a service account managed by your OpCo. Service accounts should be requested from your OpCo’s IT Service Desk. Service accounts will need to be licensed based on which connectors are used.

Power Apps

[Power Apps](#) is a technology used for anything from form customization to custom application development. It is very common for Power Apps to have some Power Automate flows in the background. Everyone at Danaher has a license for Power Apps under the E3 license. Licensing costs for Power Apps depends on the connectors and application type used.

Canvas Apps

[Canvas apps](#) are apps created form-first, usually created at make.powerapps.com. You have almost complete control over how the app looks. Canvas apps don’t require additional licensing if no premium connectors are used.

Canvas apps can also be created using the “integrate” function on modern SharePoint lists to further customize the edit and view form for that list.

Model Driven Apps

[Model driven apps](#) are apps created directly on top of tables in the Dataverse and require premium licensing for all users of the app.

Power Virtual Agents

Power Virtual Agents is a technology used to develop Chatbots that can interface with all the different Power Platform connectors.

Power Virtual Agents through Teams

Power Virtual Agents through Teams does not have any additional licensing costs but is more limited than the full Power Virtual Standalone. Danaher does not recommend using Power Virtual Agents for Teams for production use, but it is a great way to trial Power Virtual Agents. Power Virtual Agents through Teams creates a Dataverse for teams in the MS Teams environment that it was created in. Chatbots created using Power Virtual Agents through Teams can only be accessed in Teams and not over the web.

Power Virtual Agents Standalone

Power Virtual Agents Standalone requires a premium license and is used for production chatbots. Chatbots created with Power Virtual Agents Standalone have better performance than those created through Teams and can be accessed over the web as well. You will need to request a new power platform environment for your Standalone Power Virtual Agent (instructions above in the "Environments" section)

Power Pages (formerly Power Apps Portals)

Power Pages is intended as an external Portal. There are no instances of Power Pages approved in production right now since other technologies are currently able to fulfill this requirement and enabling a new external tool will require additional security approval. If you believe this is the right technology for your business need, please open a ticket with servicedesk@danaher.com and we can work with you to begin the process of enabling this product in our tenant for the first time.

Power BI

Power BI is business intelligence tool that helps organize data into easy-to-consume interactive visuals that can be easily analysed and shared. Please check the licensing guide (link is at the top of this document) if you are interested in any of the licenses mentioned in the section below.

Power BI Desktop

Power BI Desktop is free and is where most Power BI reports are initially created. Reports in Power BI Desktop can be shared once they are published in a workspace in the cloud. A Power BI Pro license is required for publishing to a workspace (not including your own personal workspace).

Power BI Workspaces

There are 3 kinds of Power BI workspaces:

My Workspace:

Every user has a personal workspace (or “My Workspace”). This is tied to your account and is one of the places you can publish to from Power BI Desktop. Reports published here can be accessed by you from any computer since it is saved to the cloud. Reports here can be shared if both you and the person you are sharing to have a Power BI Pro license. Since your personal workspace is tied to your account, it will be lost if you leave the company. Best practice is to publish production business information to one of the other workspace options.

Pro Workspaces:

Pro Workspaces are not tied to a single account, but instead have one or more owners. Workspaces are the recommended place to publish Power BI reports for production business use. Workspace creation is limited to users who are either in the “O365 Group Creators” group or the “Power BI Workspace Creators” group. If you need a workspace, please open a ticket with your OpCo’s IT Service Desk. Workspaces can be shared if the viewer has a Power BI Pro license as well, or if the workspace is converted to a Power BI Premium Capacity.

Premium Workspaces Linked to Power BI Capacity:

Premium Workspaces are identical to regular workspaces except they are linked to a Power BI Premium Capacity. This grants the workspace additional CPU power for scheduled refreshes and visuals, as well as allowing users without Power BI Pro to access reports published in premium workspaces if they are granted proper permissions. Power BI Premium Capacity admins at your OpCo will be able to create or upgrade a workspace you own to premium.

Power BI Premium Capacity

Power BI Premium capacities are managed at the OpCo level, and the owners of the capacity can assign workspaces to the capacity in order to gain the premium capacity benefits listed in the section

above. Premium capacities get “filled up” based on the demand of reports and dataset refreshes in the workspace. Once a premium capacity is full, the performance of workspaces assigned to it will degrade. To monitor usage of your premium capacity, please use the [premium metrics app](#).

For new and existing Power BI Premium capacities, we recommend you follow the [best practices](#) set by Microsoft. Please keep business critical workspaces on a separate capacity or enable autoscaling to ensure your business-critical reports will not be affected. Set multiple owners so you have a backup and ensure you have the alerts configured so you will be notified when your capacity is starting to fill up.

If you want a Power BI Premium capacity, please open a ticket with servicedesk@danaher.com and let us know who you want the owners to be.

Power BI OpCo-Managed Settings

While OpCos don't have direct access to Power BI tenant settings, they can manage some settings themselves by creating the proper AD group. If your OpCo already has these groups set up, then all you will need to do is request your OpCo's IT Service Desk to add you to the correct group to gain the access you need (such as Power BI workspace creation).

These are the groups that are currently available:

- Power BI Dataset Certifiers
- Power BI Workspace Creators

If your OpCo doesn't already have the groups set up, you will need to complete the steps below:

1. Ask your OpCo's IT Service Desk to create a new group in AD
 - a. Naming convention is [3-character company code] [Group Name]
 - b. Example: ALD PowerBI Dataset Certifiers
2. Sync the group over to Azure
3. Contact DanaHER Global Service Desk to add new group to [Group Name]
 - a. Example: Request Servicedesk@danaher.com to add “ALD PowerBI Dataset Certifiers” to “PowerBI Dataset Certifiers”
4. Any users added to your group should now have the proper rights.
 - a. Example: Users added to “ALD PowerBI Dataset Certifiers will now have dataset certification rights.

Dynamics 365

Dynamics 365 is largely managed at the OpCo level through the LCS portal through separate D365 projects. An OpCo will generally set up their D365 instance with an implementation partner with minimal input from DanaHER Corporate, with the exception of tasks that require tenant level D365 admin, since OpCo's are not generally granted tenant D365 admin permissions.

DanaHER Corporate tenant level D365 admins may on occasion need to be added as an owner to an OpCo's D365 instance to perform administrative tasks. In the case this is necessary, DanaHER Corporate will notify and coordinate this activity with the owners of the OpCo's D365 instance
